MONOTYPES IN OPERATION IN MANILA, PHILIPPINE ISLANDS.

UNITED STATES
Government Printing
Office uses
100 MONOTYPES

The MONOTYPE is the only mechanical substitute which produces work superior to hand composition. This machine has succeeded in its especial province because the principle of employment of individual type is the only one logically adapted to the needs of the general printing office.

Office of J. S. Cushing & Co.

Norwood, Mass. Oct. 29, 1905.

Gentlemen:—I am sending you in a separate package, with my compliments, two photographs; one of our keyboard department with ten young ladies busy there, and one of the casting room showing the eight casting machines with the force which runs them. I thought perhaps these might be interesting to you. These young ladies are all doing mighty good work, and their proofs are quite as free from errors as those made from hand-set type.

You might be interested to know that a representative of the competing machine visited me yesterday for the purpose of convincing me that the Linotypes were, after all, the machines I needed. I think before he left for Boston I had about convinced him that the Monotypes were by far the best machines for our purpose.

Very truly yours;

J. S. Cushing & Co.

The MONOTYPE, with its unequalled speed and efficiency, meets every demand of the great Metropolitan dailies. Because of its economy in operation, it is equally invaluable to the smallest country newspaper. For general office work it has no peer. Records of the United States Government Printing Office show the superiority of the MONOTYPE over all other machines in quality, quantity and accuracy.
